

RULE THE FRONTIER

Private credit has evolved.
Your lending system should too.

The private credit market has outgrown the infrastructure it runs on. LendOS gives you a purpose-built operating platform - one that handles the full loan lifecycle, from agent interaction and position tracking to accrual calculations and trade settlement.

Data quality improves at the source. Workflows automate the routine so your team can focus on the exceptions that actually require judgment. And because LendOS is API-first, it integrates into your tech stack on your terms.

This is infrastructure that is purpose-built for direct lending at scale - **Rule the frontier.**

Designed to Perform

- Built for loans, not repurposed from something else.
- Handles complex structures - DDTLs, delayed draws, PIK, and beyond.
- API-first - connects to the tools you already use.
- Cloud-based and configurable.
- Your data stays yours.

Product Highlights

- **Bulk uploads** - data in and out at scale.
- **Intuitive UI** - productive from day one.
- **Purpose-built for private credit** - not retrofitted from BSL.
- **Document generation** - trade docs at your fingertips.
- **Internal transfers** - settle fast, settle easy.

BUILT FOR USERS

Private credit operations move fast. Your platform should keep up - not slow you down with training plans and workarounds. LendOS is built for the people who keep the market running. New hires contribute from day one. Experienced operators never fight the software to get work done.

BUILT TO ADAPT

Private credit doesn't stand still - your platform shouldn't either. LendOS updates continuously, so your operations stay current without waiting on a biannual release cycle. Built on modern infrastructure, it evolves alongside the market rather than falling behind it.

BUILT TO WORK

API-first and cloud-native, LendOS is engineered to integrate - not isolate. It slots into your existing tech stack cleanly, connecting to the tools and systems your operations already depend on.

THE LENDOS DIFFERENCE

Private credit runs on complexity.
Your platform should be built for it - not around it.
